1.0 INTRODUCTION

This report was prepared by the Southern Nevada Water Authority (SNWA) in satisfaction of monitoring and reporting requirements set forth in the *Hydrologic Monitoring and Mitigation Plan for Delamar, Dry Lake, and Cave Valleys* (DDC3M Plan) (SNWA, 2011a). The location of the primary monitoring area associated with this plan is presented in [Figure 1-1](#). This is the eighth hydrologic data report in a series of reports associated with the Delamar, Dry Lake, and Cave valleys (DDC) hydrologic monitoring, management, and mitigation program. The reports document historic hydrologic conditions and plan status since 2007 (SNWA, 2008, 2009b, 2010, 2011b, 2012, 2013, and 2014).

The report provides the Nevada State Engineer (NSE) hydrologic data collected in 2014 and the current status of each element of the DDC3M Plan. This report also satisfies the hydrologic data collection and reporting requirements of the U.S. Department of the Interior (DOI) and SNWA Stipulation Agreement. The DDC3M Plan contains all the hydrologic monitoring elements of the Stipulation Agreement, as well as, monitoring related to existing non-federal water-rights as required by the NSE.

1.1 Background

On January 7, 2008, prior to the NSE hearing for applications 53987 through 53992, a Stipulation for Withdrawal of Protests (Stipulation, 2008) was executed between SNWA and DOI on behalf of the Bureau of Indian Affairs, the Bureau of Land Management (BLM), the National Park Service, and the U.S. Fish and Wildlife Service (USFWS) (collectively known as the DOI Bureaus). Exhibits A and B of the Stipulation require the development of biologic and hydrologic monitoring plans. As part of the Stipulation, an Executive Committee (EC) was established to oversee the implementation of the agreement. A Technical Review Panel (TRP), composed of technical expert representatives of parties to the stipulation, was established to develop and oversee implementation of the hydrologic monitoring, management, and mitigation plan. A Biological Resource Team (BRT) was also established to oversee the development and implementation of the biological monitoring plan.

On July 9, 2008, SNWA was granted groundwater rights in DDC hydrographic areas (HA180-182) for municipal and domestic purposes under permits 53987 through 53992. Ruling 5875 required the development of biologic and hydrologic monitoring plans. The hydrologic DDC3M Plan associated with this ruling was approved by the NSE on December 22, 2009.

Since the issuance of Ruling 5875, an opinion by the Nevada Supreme Court required that the NSE re-notice SNWA's original groundwater applications and reopen the protest period (*Great Basin Water Network, et. al. v. NSE, et. al.*, June 17, 2010) (NSC, 2010). A new hearing was held by the NSE in regard to the water-right applications in September through November, 2011. On March 22, 2012, the

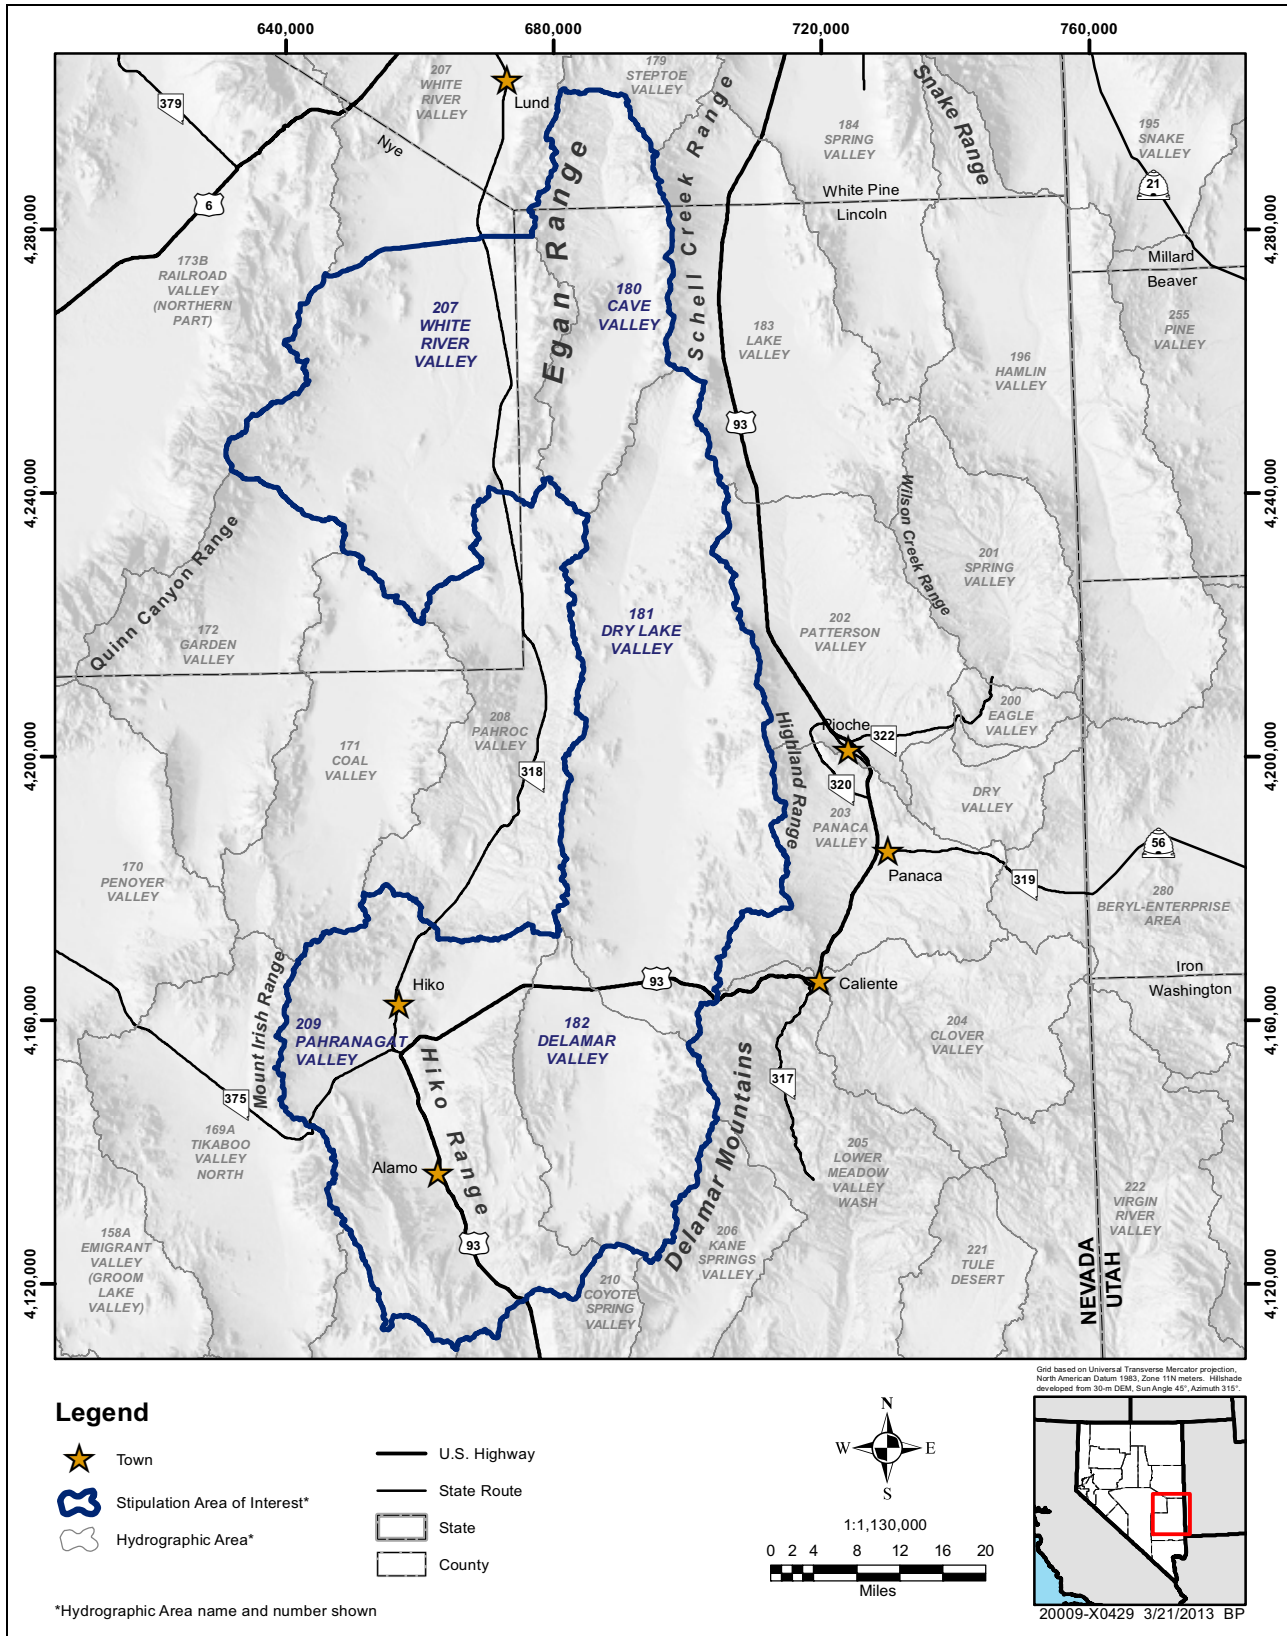

Figure 1-1
DDC3M Plan Primary Monitoring Area

NSE issued Rulings 6165 through 6167 granting SNWA DDC applications 53987 through 53992. Rulings 6165 through 6167 approved the SNWA Hydrologic Monitoring and Mitigation Plan for DDC and required annual data reports be submitted to the NSE.

1.2 Major Activities Performed in 2014

Major activities associated with the DDC3M Plan completed in 2014 are as follows:

- Continued implementation of the DDC3M Plan.
- Performed periodic water-level measurements on monitoring network wells. Maintained continuous water-level and spring discharge recording instrumentation at locations specified in the plan.
- Submitted required monitoring data quarterly to the NSE and the TRP. Maintained the SNWA data-exchange web site accessible by NSE, EC, TRP, and BRT.
- Maintained BLM right-of-way access for three future monitor-well locations.

1.3 Report Scope

[Section 2.0](#) of this report presents the hydrologic data collected from the groundwater, spring, and precipitation monitoring networks associated with the DDC3M Plan. [Section 3.0](#) presents anticipated activities in 2015. [Section 4.0](#) documents report references. [Appendix A](#) through [Appendix F](#) present tables and graphs of various hydrologic data discussed in the report. Photos documenting 2014 spring and fall conditions of program springs located within DDC are also presented.

This Page Left Intentionally Blank

2.0 DDC3M PLAN STATUS AND DATA

The hydrologic data collected in Calendar Year (CY) 2014 and the current status of each major element of the DDC3M Plan are presented in this section.

2.1 Hydrologic Monitoring Program

The DDC3M Plan requires a hydrologic monitoring program and network be established to collect data for the purposes of defining baseline hydrologic conditions prior to SNWA groundwater withdrawals in DDC and evaluating the effects of these withdrawals. The network includes monitor wells and springs located within DDC and adjacent hydrographic areas. The monitoring locations are presented on [Figure 2-1](#). The plan also requires reporting of available regional precipitation-station data with an established historical record.

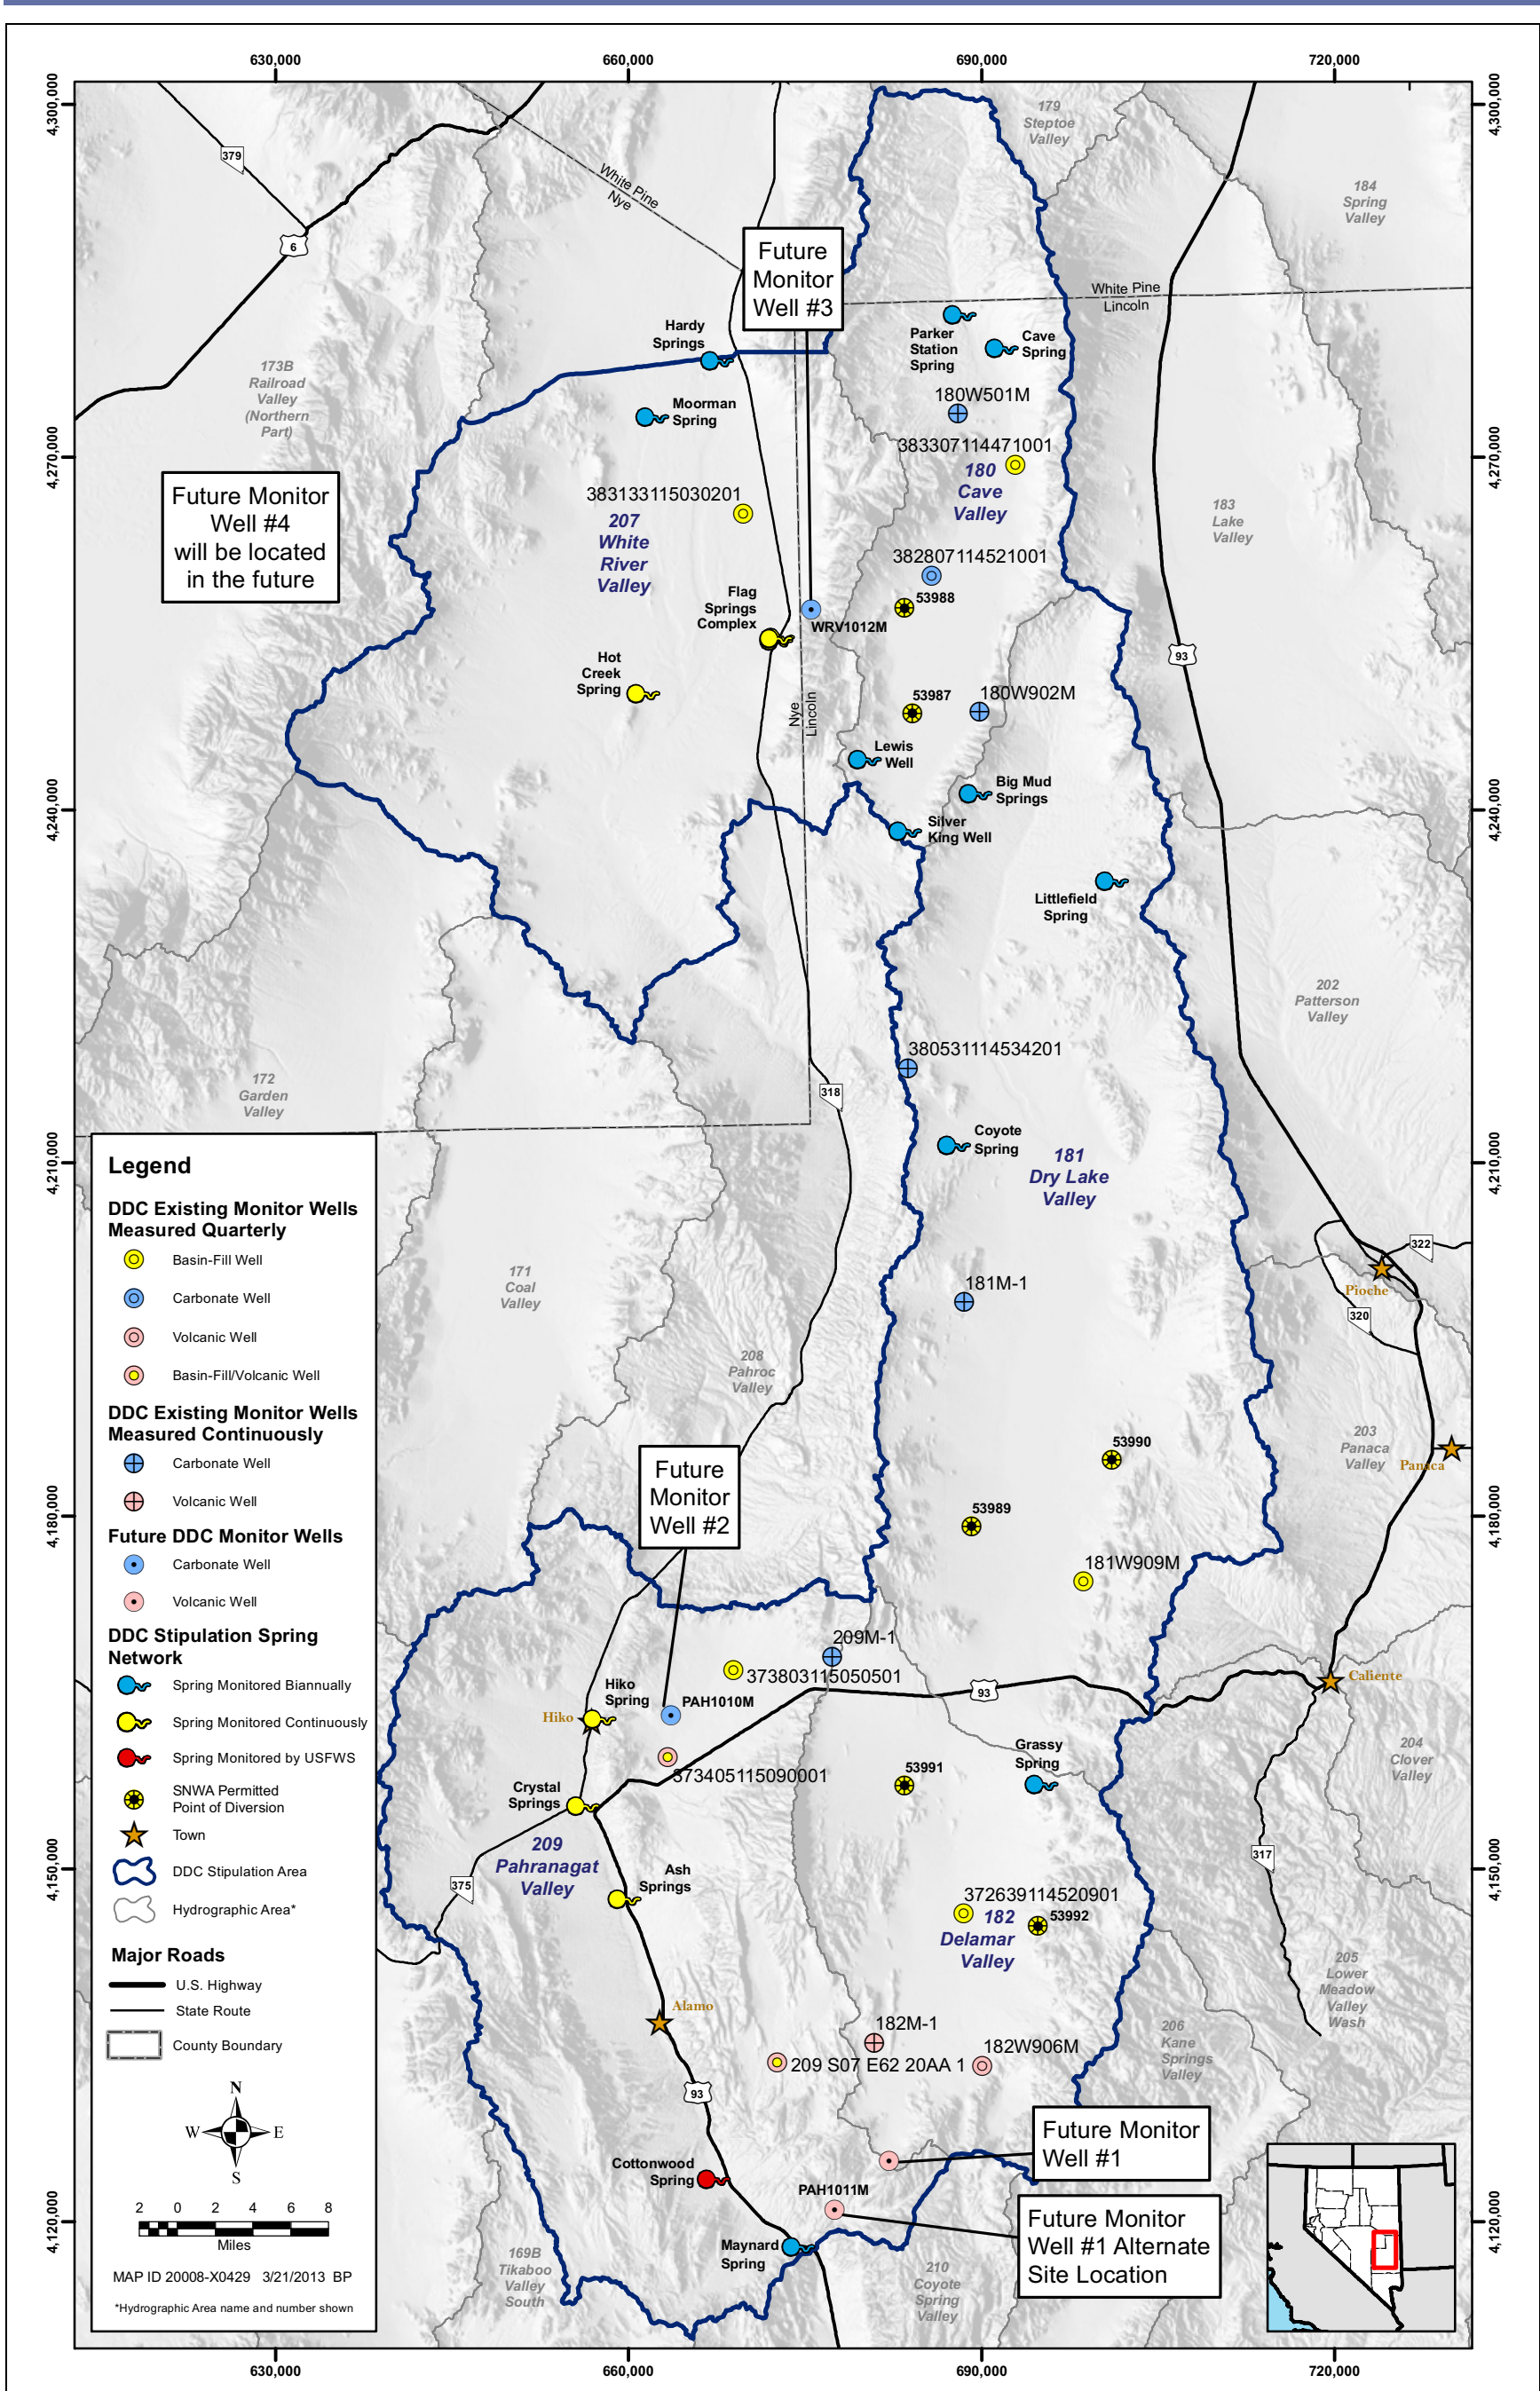

2.2 Monitor-Well Network

The DDC3M Plan includes monitoring of new and existing wells completed in the basin-fill, carbonate-rock, and volcanic-rock aquifers at strategic locations to provide representative groundwater data across the program area. Monitor-well locations were selected with consideration of the hydrogeologic conditions at each location. Water-level measurements were regularly collected from the wells in accordance with SNWA field operating procedures. Geologic reconnaissance, stratigraphic and structural field mapping, aerial photo documentation, surface geophysics, and a review of existing hydrogeologic data were performed to assist in well-site selection. This network will provide long-term monitoring of groundwater conditions and early detection of drawdown propagation, if any, induced by SNWA groundwater development that might adversely affect existing water-right holders and groundwater-dependent areas sustaining critical habitat for endangered and/or threatened species.

2.2.1 Existing-Well Monitoring Network

The DDC3M plan includes continuous groundwater level data collected at six representative monitor wells in the project area. Groundwater levels are also measured quarterly at nine additional network well locations associated with the DDC3M Plan. This network includes seven SNWA wells, three private wells, four U.S. Geological Survey (USGS) MX wells, and one BLM well located in DDC and the adjacent White River Valley and Pahranaagat Valley hydrographic areas. The locations of the monitor wells in the network are shown on [Figure 2-1](#). Well-location coordinates, elevation, construction attributes, and monitoring frequencies are presented in [Table 2-1](#). Professional surveys of location coordinates, ground-surface elevations, and measuring-point elevations of the wells were completed in 2008, 2009, and 2011.

This Page Intentionally Left Blank

Note: Flag Springs Complex has been monitored biannually; continuous monitoring of Flag Spring 2 was implemented in fall 2009.

^aProfessional survey complete on location and elevation. All coordinates are Universal Transverse Mercator, North American Datum, 1983, Zone 11.

^bStation Local Numbers provided by the Nevada Division of Water Resources.

^cElevations are North American Vertical Datum of 1988 (NAVD88).

^dCarbonate bedrock was encountered at 265 ft bgs according to the well log.

^eWell is monitored continuously by the USGS.

Well-construction data are based upon best available information from well logs, MX Project Report (Ertec Western Inc., 1981), and direct field measurements.

Monitoring frequency agreed to by the TRP.

SNWA constructed seven monitor wells associated with this network in 2005. These consist of four 6-in. diameter and three 12-in. diameter monitor wells in DDC. Geologic analysis reports were completed for each of the seven SNWA monitor wells included in the network (Eastman, 2007a through g). Copies of the reports have been posted on the SNWA data-exchange web site.

Continuous water-level data were collected at the six designated monitor wells within the network. Site visits were performed approximately once every quarter to obtain periodic water-level measurements and download continuous data for processing and analysis. Physical measurements of water levels were compared to pressure transducer data to verify proper function of the instrumentation.

The USGS collects continuous data at two USGS-MX wells within the network 372639114520901 USGS-MX (Delamar Well) and 380531114534201 USGS-MX (N. Dry Lake).

Periodic water-level measurements collected by SNWA in CY 2014 are presented in Appendix A. Period of record and CY 2014 hydrographs for the nine existing DDC network wells that are monitored quarterly are also presented in Appendix A. Water-level data collected by SNWA and USGS at the six continuously monitored network wells are presented in Appendix B. Appendix B also includes tables presenting periodic and daily mean continuous water-level data as well as associated CY 2014 and period of record hydrographs. Period of record USGS data are presented at the National Water Information System’s website at http://waterdata.usgs.gov/nv/nwis/gw.

2.2.2 Future Monitor Wells

The installation of four new monitor wells is required by the monitoring plan. In 2009, three primary sites and one contingency site were selected by the TRP and NSE for the installation of three of the monitor wells. The location of the fourth well will be selected after additional baseline data are collected and information is known regarding future production-well locations. Location coordinates of future monitor wells, estimated surface elevation and depth to groundwater are presented in Table 2-2. The future monitor-well location sites are presented in Figure 2-1.

**Table 2-2
Future DDC Monitor Wells**

Well Name	Location ^a		Estimated Surface Elevation (ft amsl)	Estimated Depth to Water (ft)
	UTM Northing (m)	UTM Easting (m)		
WRV1012M	4,257,087	675,519	5,794	420
PAH1010M	4,163,098	663,576	4,380	700
DEL4003X	4,125,223	682,153	4,738	1,450
PAH1011M (alternate site)	4,121,019	677,508	3,727	635

^aAll coordinates are Universal Transverse Mercator, North American Datum, 1983, Zone 11.

The northernmost future monitor well, WRV1012M, is located on the west side of the Egan Range northeast of Flag Springs in White River Valley. This well is anticipated to be completed in the Ely Springs Dolomite. The location was selected as a monitoring point between Flag Springs and southern Cave Valley. The new well and other existing monitor wells in Cave Valley will provide baseline water-level data to assist in the evaluation of the hydraulic gradient through Shingle Pass. The depth to groundwater is estimated to be approximately 420 ft bgs at this location.

The second future monitor well, PAH1010M, is located on the east side of the Hiko Range in Sixmile Flat in Pahranaagat Valley. The site is located 3.5 mi east of Hiko Spring. The target completion zone is saturated fractured carbonate rocks within the middle to lower units of the Guilmette Formation and possibly the Simonson Dolomite. Carbonate bedrock is anticipated to be encountered within 50 ft of land surface, and it is expected that rocks will be fractured at depth because of the movement along the range-front fault and ancillary normal faults. The depth to water in this area is estimated to be approximately 700 ft bgs.

Both WRV1012M and PAH1010M are located on BLM managed land, and right-of-way applications have been approved and are being maintained.

The third future monitor well will be installed at the well site of a proposed SNWA exploratory well, DEL4003X, which is located near the southern boundary of Delamar Valley within a structural feature of the Pahranaagat Shear Zone. This well is anticipated to be completed in volcanic materials. An alternative site, PAH1011M, was identified and is also located along a major structural feature of the Pahranaagat Shear Zone but southwest of the exploratory well site. The right-of-way applications have been approved by BLM for both locations. Selection of the primary or alternative site for a monitor well will be determined in consensus with the TRP.

2.2.3 Exploratory- and Production-Well Monitoring

The exploratory and production-well monitoring section of the DDC3M Plan states that SNWA shall record discharge and water levels in all completed SNWA production wells on a continuous basis. SNWA has not constructed any production wells associated with this project; however, continuous measurements will be collected from all future production wells. Quarterly water-level measurements are required in all SNWA exploratory wells.

Water-level data were collected quarterly from two SNWA exploratory and test wells. The wells, one 6-in. diameter monitor well (CAV6002M2) and one 20-in. diameter test well (CAV6002X), were installed in southern Cave Valley near Monitor Well 180W902M on October 13 and 28, 2007, respectively. Well-construction attributes and the locations of the two wells are presented in [Table 2-3](#) and [Figure 2-2](#). Periodic water-level data and the associated hydrographs from the test and exploratory wells are presented in [Appendix C](#).

2.2.4 Aquifer Testing

A constant-rate pumping test will be performed on each future production well to evaluate aquifer properties. Aquifer-testing results will be used to assess well performance, provide aquifer- property

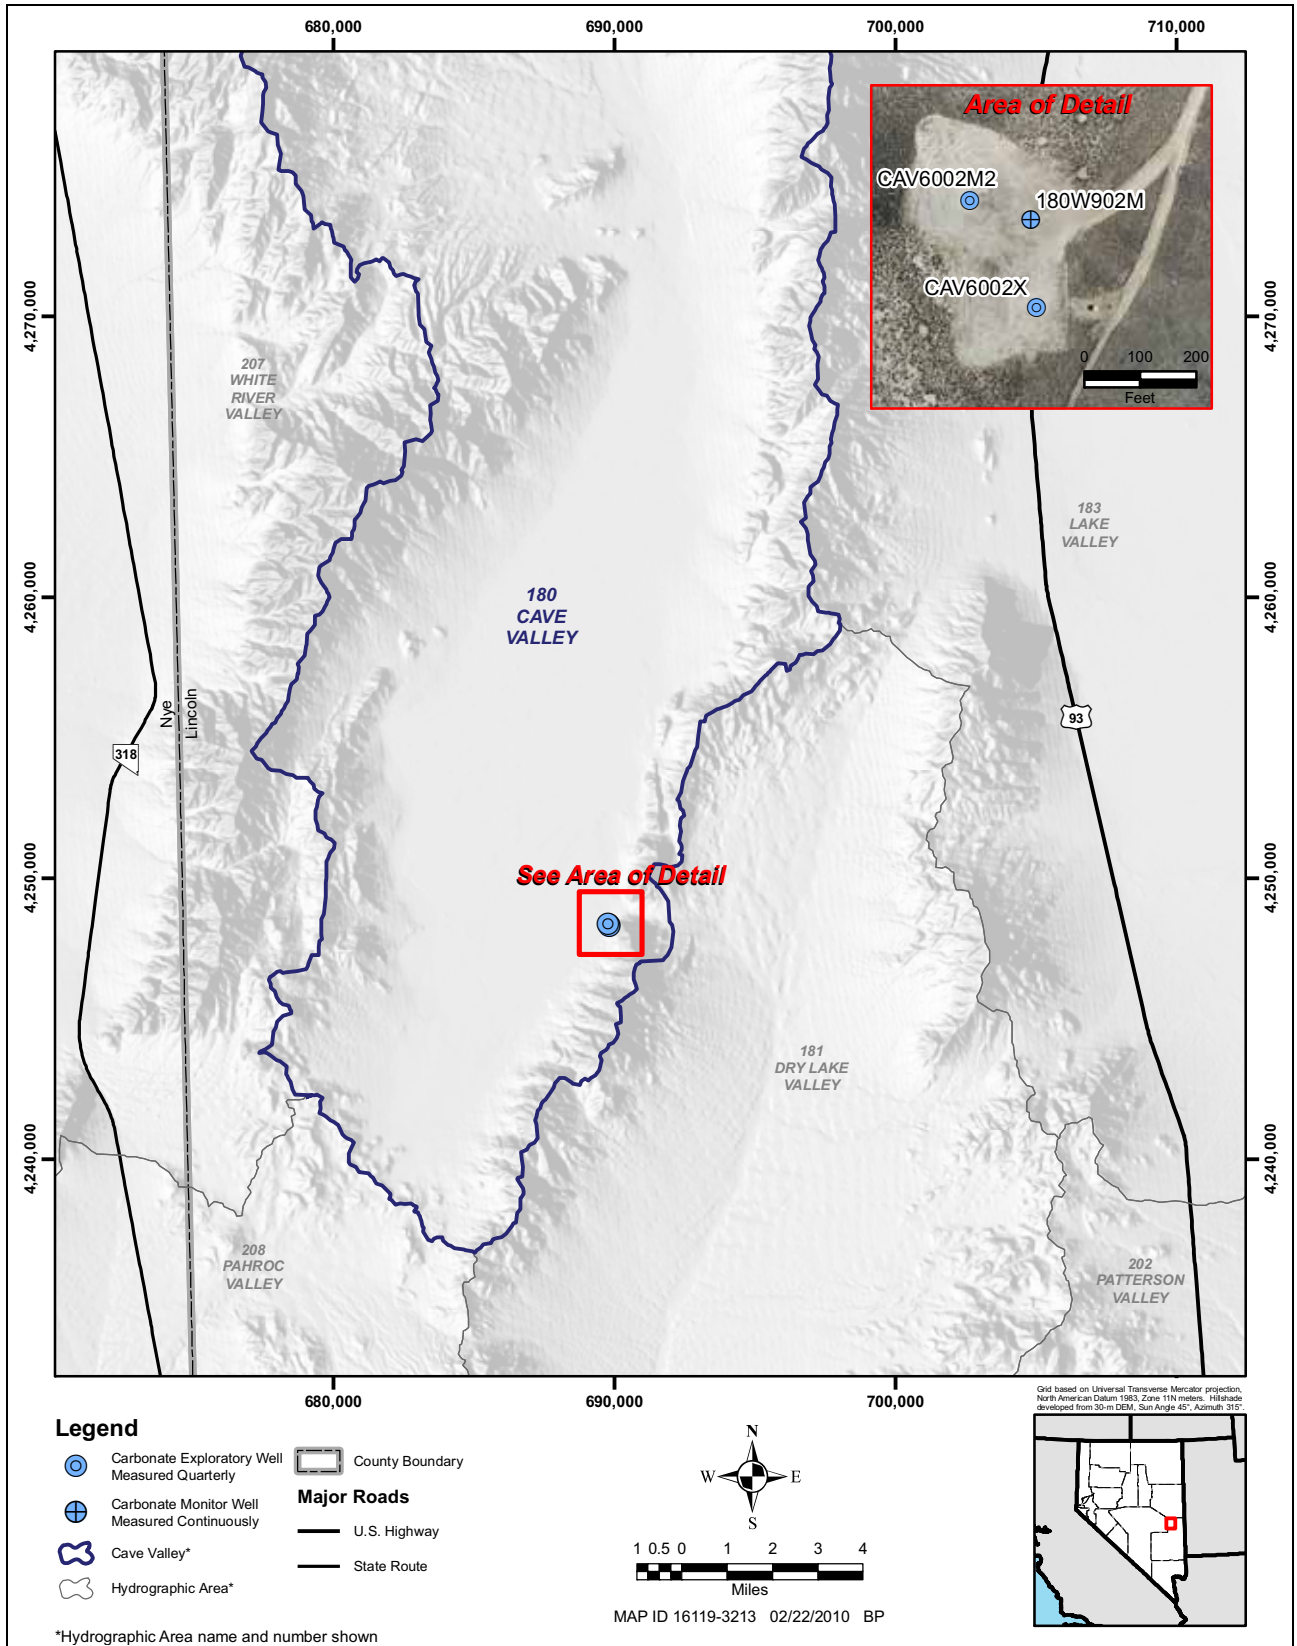

Figure 2-2
SNWA DDC Exploratory Wells

data and assist in evaluating potential future pumping effects. Well-performance step tests and 72-hour constant-rate tests have been performed on SNWA Test Well CAV6002X and Monitor Well 180W902M located in Cave Valley. A summary and results of the tests are presented in *Hydrologic Data Analysis Report for Test Well CAV6002X in Cave Valley Hydrographic Area 180* (Prieur et al., 2011).

2.3 Spring Monitoring Network

The DDC3M Plan spring monitoring network has two components each of which were implemented in 2009. The first component consists of nine springs in White River and Pahranaagat valleys that are monitored for discharge. The second component consists of eight springs within DDC that are monitored biannually for discharge (if measurable), field water-quality parameters, and general physical condition. The spring locations and monitoring frequency are listed in [Table 2-4](#) and presented in [Figure 2-3](#). Baseline photos of all spring locations and detailed descriptions were presented in SNWA (2009b). A description of each spring and corresponding discharge data are presented in this section.

2.3.1 White River and Pahranaagat Valleys Springs

Nine springs located in White River and Pahranaagat valleys are included in the spring monitoring network. Hot Creek, Ash, and Crystal springs are currently being monitored continuously through a cooperative funding agreement (CFA) between SNWA, USGS, and the Nevada Division of Water Resources (NDWR). USGS also measures discharge biannually at Flag Springs and Moorman Spring as part of the CFA.

SNWA established spring discharge monitoring sites at Hardy and Hiko springs in 2009. SNWA and NSE staff worked together to secure property access to install the flume at Hardy Springs, and a flow meter and data logger at Hiko Spring. The flow meter provides continuous discharge data on the agricultural diversion pipeline to which Hiko Spring is diverted.

SNWA coordinated with the Nevada Department of Wildlife (NDOW) to install a flume and continuous-monitoring instrumentation at Flag Spring 2 (Middle Flag Spring) in 2009. Flag Spring 1 and 3 continue to be measured at least quarterly by SNWA and biannually by USGS.

Maynard Spring is monitored quarterly by SNWA. SNWA will document conditions at this site dependent upon continued property access. Cottonwood Spring is monitored by USFWS, however no data were provided by USFWS for inclusion in this report.

2.3.1.1 Flag Springs

The Flag Springs are located in Nye County at the NDOW Headquarters for the Wayne Kirsch Wildlife Management Area approximately 60 mi south of Ely, Nevada, along Nevada State Route (SR) 318 ([Figure 2-3](#)). Three primary springs (South, Middle, and North) compose the Flag Springs complex which forms the headwaters of Sunnyside Creek. Sunnyside Creek flows into the Adams-McGill Reservoir where the water is used for livestock, wildlife, and recreation.

**Table 2-4
DDC Springs Monitoring Locations and Monitoring Frequency**

Basin Number	Station Number	Station Name	Elevation ^a	Location ^b		Monitoring Frequency
				UTM Northing (m)	UTM Easting (m)	
180	1800101	Cave Spring	6,490	4,279,249	691,760	Biannual

	2090801	Maynard Spring	3,110	4,117,909	674,444	Biannual ^d
Flag Springs						
207	2071301	Flag Spring 3 (South)	5,290	4,254,416	672,579	Quarterly
	2071302	Flag Spring 2 (Middle)	5,280	4,254,570	672,576	Continuous
	2071303	Flag Spring 1 (North)	5,290	4,254,696	672,719	Quarterly
Crystal Springs						
209	09415589	Crystal Springs Diversion near Hiko, NV	3,820	4,155,336	656,011	Continuous
	2090401	Crystal Springs near Hiko, NV	3,800	4,155,348	656,165	
Ash Springs						
209	09415639	Ash Springs Diversion at Ash Springs, NV	3,600	4,147,415	659,716	Continuous
	2090501	Ash Springs	3,600	4,147,460	659,684	

^aAll elevations are rounded to the nearest 10 ft, North American Vertical Datum, 1988 (NAVD88). High-resolution Global Positioning System (GPS) will be used to determine elevations at a later date.

^bAll coordinates are Universal Transverse Mercator, North American Datum, 1983 (NAD83) Zone 11.

^cMonitoring performed by USFWS and data to be provided to SNWA and presented in the annual data report.

^dMonitoring frequency will be increased to quarterly after monitoring points are established in consultation with USFWS and BLM.

Monitoring at Flag Springs currently consists of continuous monitoring of Flag Spring 2 (Middle Flag Spring), which was installed through a cooperative project with NDOW and SNWA, in November 2009, and monitoring of Flag Spring 1 and 3 (North and South Flag Spring) orifices at least quarterly by SNWA and twice a year by USGS.

The earliest reported discharge measurement of 2.5 cfs was taken at Flag Spring 1 in 1949 (Maxey and Eakin, 1949). The USGS, beginning in 1982, measured the discharge of the three springs annually. During 1992, the discharge measurements were increased to a biannual frequency that continued through the end of 1994. No discharge measurements were reported between 1995 and 1996. During 1997, the springs were again measured by the USGS biannually, which continued through 2008, as part of the CFA with SNWA and NDWR. Miscellaneous discharge measurements

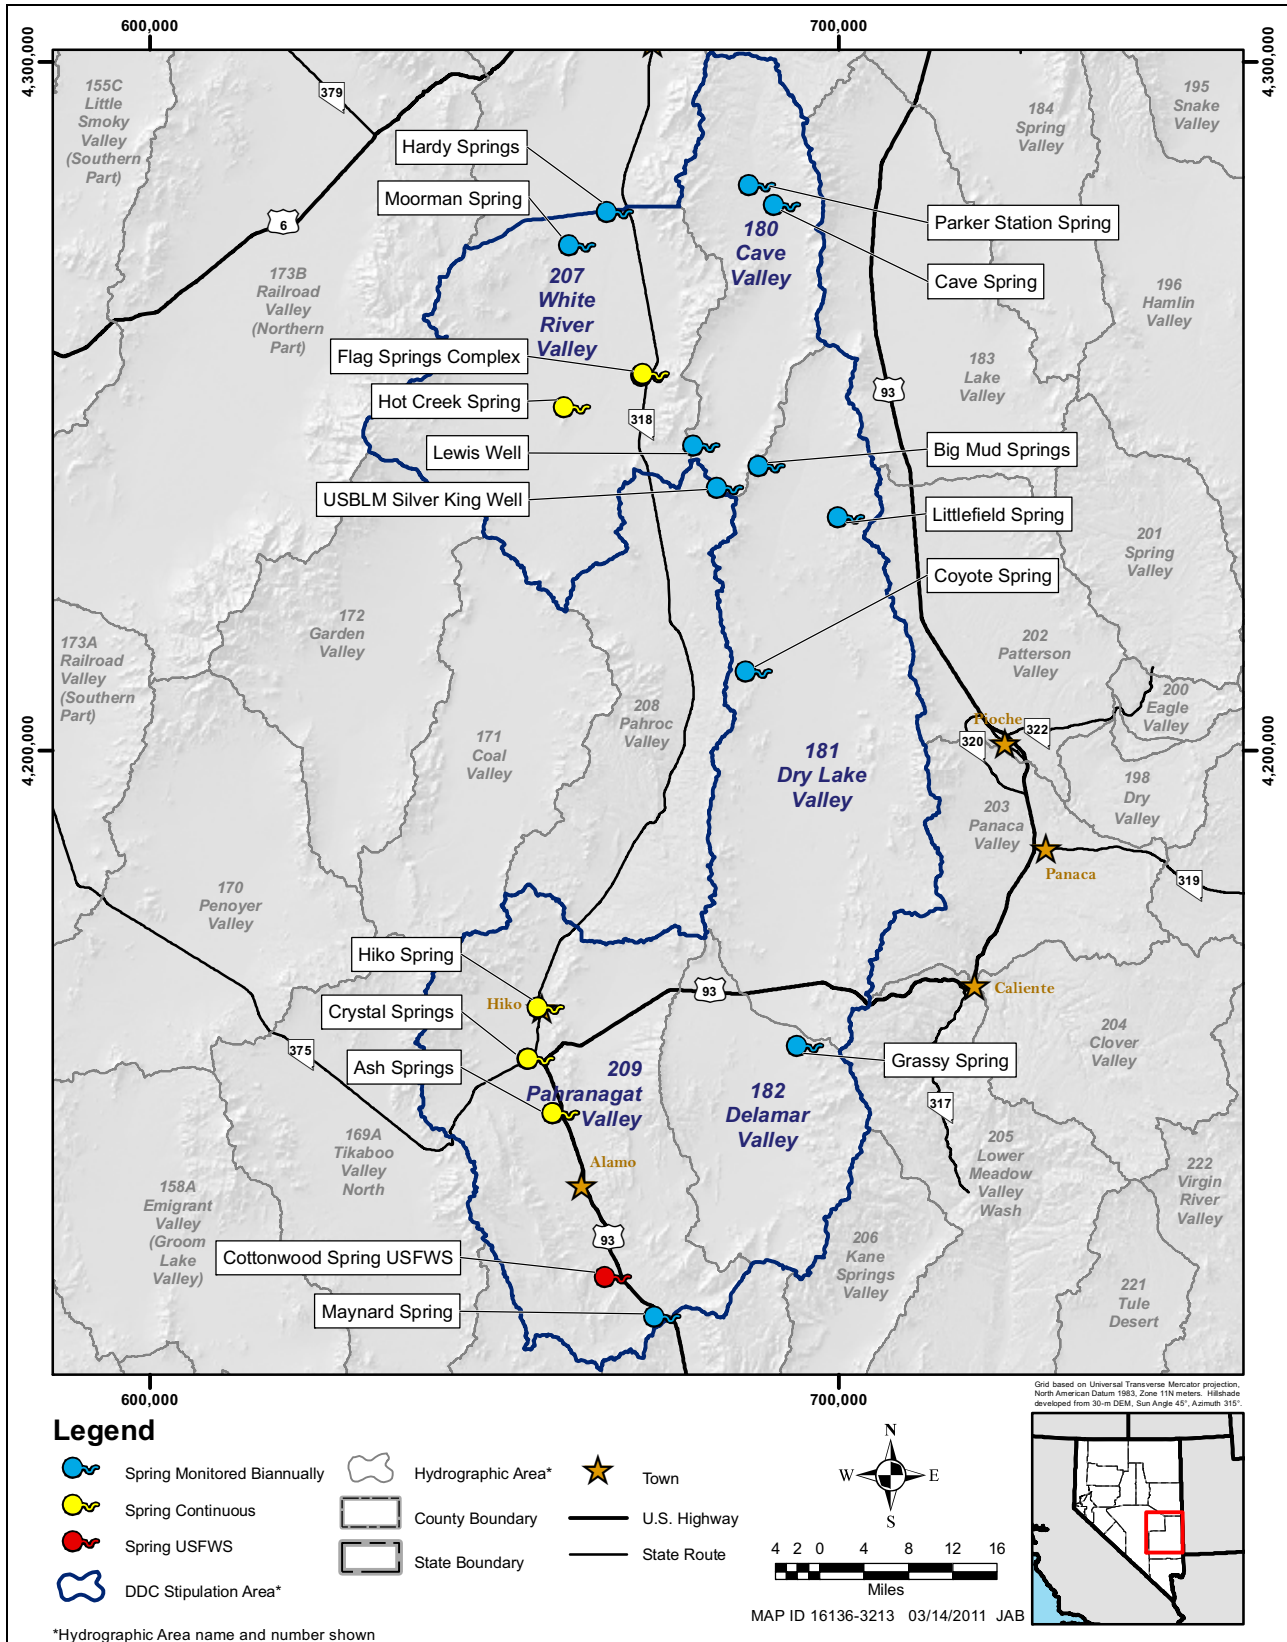

Figure 2-3
Locations of Springs Associated with the DDC3M Plan

for 2014 and a historical hydrograph are presented in [Appendix D](#). A continuous discharge hydrograph for Flag Spring 2 is also presented in [Appendix D](#).

2.3.1.2 Hardy Springs

Hardy Springs is located approximately 16 mi south of Lund, Nevada, and 1.5 mi west of SR 318 in White River Valley in Nye County ([Figure 2-3](#)). Hardy Springs is composed of five individual spring orifices that discharge into a main channel that is a tributary to the White River. In August 2009, SNWA installed a new flume to obtain biannual discharge measurements upstream of an old diversion approximately 100 to 150 ft downstream of the confluence of Hardy Springs. Hydrologic data collected in 2014 are presented in [Appendix D](#).

The channel between Hardy Springs and the flume was modified by a contractor with permission from the landowner to provide a water source to a power transmission line construction project. Photographs of the original condition of the channel and the modified condition with reservoir are presented in SNWA (2014). Discharge measurements performed by SNWA in 2014 used a 3-in. modified Parshall Flume located between the confluence of the five springs and reservoir inlet.

2.3.1.3 Moorman Spring

Moorman Spring is located in White River Valley approximately 20 mi southwest of Lund, Nevada, in Nye County ([Figure 2-3](#)). The spring discharges from the alluvium along a fault scarp. The spring forms a small pool, approximately 30 ft long and 15 to 20 ft wide, behind an old irrigation diversion structure. The discharge at Moorman Spring is currently measured biannually through the CFA.

In 1935, the reported discharge was 0.22 cfs (Stearns et al., 1937). This discharge measurement was likely influenced by the extreme drought in the western United States during the mid-1930s. The same 1935 discharge measurement was again reported in Miller et al. (1953). Since 1935, the average discharge at Moorman Spring has been approximately 0.43 cfs, and the historical discharge measurements appear relatively constant. Discharge data collected at Moorman Spring during 2014 and a hydrograph of the historical data are presented in [Appendix D](#).

2.3.1.4 Hot Creek Spring

Hot Creek Spring is located in southern White River Valley, approximately 36 mi southwest of Lund, Nevada, and 2 mi west of Adams-McGill Reservoir in Nye County ([Figure 2-3](#)). The spring discharge forms Hot Creek, which flows southeast to the Adams-McGill Reservoir. The spring and reservoir are located on the Wayne Kirch Wildlife Management Area, administered by NDOW. At one time, the flow of Hot Creek could be diverted to the Dacey Reservoir to the northeast. Spring discharge is currently being monitored continuously by USGS through the CFA.

A detailed description, site photos, and discussion of historical measurements at Hot Creek Spring are presented in SNWA (2009b). Data collected through 2014, along with historical mean daily discharge data from 2006 to 2014 are provided in [Appendix D](#). Discharge measurements prior to 2006 were measured below the current gage, 50 to 60 ft below the ponded swimming area.

2.3.1.5 Ash Springs

Ash Springs is located in Ash Springs, Nevada, approximately 600 ft east of U.S. Highway 93 (US 93) ([Figure 2-3](#)). The spring is used for irrigation, domestic supply, and recreation and is composed of many orifices that extend more than a quarter mile along the north-south-trending Hiko Fault. The spring area was developed in the 1970s and through the 1980s as a privately owned resort. The main orifice is on public land administered by the BLM. Ash Springs discharge and irrigation diversion are currently measured by the USGS using two gaging stations which are funded through the CFA. The two stations were relocated by the USGS in 2011.

A detailed description, photos, and discussion of historical data collected at Ash Springs are presented in SNWA (2009b). Hydrologic data collected through the 2014 water year, historical mean daily discharge, and a 30-day moving average of mean daily discharge values for Ash Springs are presented in [Appendix D](#).

2.3.1.6 Crystal Springs

Crystal Springs is located approximately a quarter mile west of the SR 318/SR 375 junction and a half mile west of the US 93/SR 318 junction in Lincoln County. Crystal Springs is approximately 4 mi south of Hiko, Nevada, and 5 mi north of Ash Springs, Nevada ([Figure 2-3](#)). This locale, used as a watering location and campsite, was the principal stopover on the Mormon Trail alternate route (State of Nevada, 2004). Discharge from the main channel of the spring and irrigation diversion is currently monitored by USGS through the CFA.

A detailed description and photo documentation of Crystal Springs are presented in SNWA (2009b), including a discussion of the historical data collected at the spring complex. Hydrologic data collected through the 2014 water year, historical mean daily discharge, days of diversion, and annual discharge data are presented in [Appendix D](#).

2.3.1.7 Hiko Spring

Hiko Spring is located on the Cannon Ranch approximately a half mile northeast of Hiko, Nevada, in the north end of Pahrangat Valley ([Figure 2-3](#)) and has historically provided water for various uses. Hiko Spring discharges from the base of the Hiko Range and currently provides water for domestic, agricultural, and wildlife purposes.

SNWA monitors discharge at Hiko Spring continuously using a flow meter and datalogger installed on the 18-in.-diameter pipe located approximately 0.5 mi southwest of the spring. The monitoring station was constructed in June 2009 in cooperation with the Hiko Spring Irrigation District and the owners of the Cannon and Whipple Ranches.

The Hiko Irrigation Company uses a perpetual calendar which assigns irrigation times to each of the twelve members of the company. One complete rotation of the 12 users equates to 11.5 days. There are periods during each rotation when water is diverted above the flow meter. Daily discharge rates vary between 4.3 to 8.3 cfs depending upon the season and irrigation needs of the individual users.

A detailed description and photo documentation of Hiko Spring are presented in SNWA (2009b), including a discussion of the historical data collected at the spring complex. Hydrologic data collected during the 2014 water year and a historical hydrograph are presented in [Appendix D](#).

2.3.1.8 Maynard Spring

Maynard Spring is located off of US 93 about 14 mi southeast of Alamo, Nevada, and 2.5 mi southeast of Lower Pahranaagat Lake on BLM land in Pahranaagat Valley ([Figure 2-3](#)). The spring is composed of two springheads, referred to as North Maynard Spring and South Maynard Spring, which are separated by a distance of roughly 400 ft. Photos of Maynard Spring in May and October 2014 are presented in [Figures E-1](#) and [E-2](#) of Appendix E. Observations in 2014 indicated no measurable discharge.

2.3.1.9 Cottonwood Spring

Cottonwood Spring is approximately 9.5 mi south of Alamo, Nevada, 1 mi west of US 93 on the USFWS Pahranaagat Wildlife Refuge ([Figure 2-3](#)), and 1.5 mi south of the Refuge Headquarters along the Corn Creek/Alamo Road. As per Exhibit A of the Stipulation, USFWS is to provide data collected from Cottonwood Spring to the TRP; however, no data have been provided to date. SNWA will include any discharge measurements collected and provided by USFWS in the annual data report. The water at Cottonwood Spring is used for wildlife. Photo documentation and historical data reported for Cottonwood Spring is presented in SNWA (2009b).

2.3.2 DDC Springs Biannual Monitoring

Eight spring monitoring locations within the DDC valleys were selected by the TRP in consultation with the NSE for biannual monitoring. These springs are generally characterized as being sourced in the mountain block and having no hydraulic connection to the regional aquifer. However, biannual baseline monitoring is being performed to document variability in spring conditions.

Springs included in the program are Grassy Spring in Delamar Valley; Coyote, Big Mud, and Littlefield springs in Dry Lake; Parker Station and Cave springs in northern Cave Valley; and Lewis Well and Silver King Well in southern Cave Valley. Spring locations are presented in [Figure 2-3](#). Several of the springs (Grassy, Big Mud, Coyote, and Lewis Well) have been modified in the past with a collector system to transmit water to distribution points away from the spring. Silver King Well is a shallow dug well with a gravity discharge line routed to a stock water area.

Field visits to the sites are conducted in the spring and fall of each year when site-access conditions permit. Spring water-quality is measured in the field for pH, electrical conductivity, and temperature. Photographs are taken to document site conditions.

Physical descriptions, photos, and historical hydrologic and water-chemistry data for the springs are presented in SNWA (2009b).

Site visits were performed in May and October 2014. Data collected during the visit and photo documentation are presented in [Appendices D](#) and [E](#), respectively.

2.3.2.1 Cave Spring

Cave Spring is located at the far southwest corner of a low northeast-southwest-trending hill approximately 3 mi southeast of Parker Station, Nevada ([Figure 2-3](#)). The decrease in discharge rates during the summer months and the cold temperature of the water indicate that this spring is fed solely by local recharge. Biannual discharge measurements and conditions are being documented at the spring with permission from the owner, Cave Valley Ranch, LLC.

A detailed description and photo documentation of Cave Spring are presented in SNWA (2009b), including a discussion of historical data collected at the spring. Hydrologic data collected during 2014 are presented in [Appendix D](#). A photo of the spring, taken in May 2014, is presented in [Figure E-3](#). The photo taken in October 2014 is presented in [Figure E-4](#). Both photos show dry conditions.

Currently, there are no active diversions at the spring. Historically, it appears that a small, hand-dug well was constructed in the stream channel and was used to divert water by pump. The water now flows freely down the channel into a small reservoir in the center of the valley where it is used for livestock watering.

2.3.2.2 Parker Station

Parker Station is in north-central Cave Valley, approximately 16 mi southeast of Lund, Nevada. Parker Station was once used as a stagecoach station. This site is located in Lincoln County, nearly a mile south of the White Pine/Lincoln County line.

Parker Station Spring lies on Cave Valley Ranch, LLC, property. A photo of spring discharge in the Parker Station Area in May and October 2014 are presented in [Figures E-5](#) and [E-6](#), respectively. A photo of a permanent flume in the southern reservoir discharge channel owned by Cave Valley Ranch, LLC, is presented in [Figure E-7](#). Currently some water flows around the flume. Discharge just upstream of the southern reservoir channel flume is measured by SNWA using a temporary flume twice a year.

2.3.2.3 Lewis Well

The Lewis Well is located in southern Cave Valley, approximately 36 mi south of Lund, Nevada, and 6 mi east of SR 318 ([Figure 2-3](#)). It is located at the base of the Egan Range on the eastern slope. The well was reportedly constructed in 1925 and was completed with a 42-in. steel casing to a depth of 26 ft. Photos of the springhead area for Lewis Well taken in May and October 2014 are presented in [Figures E-8](#) and [E-9](#), respectively. A photo of spring discharge at a manhole access to a collection system near the spring head is presented in [Figure E-10](#).

2.3.2.4 Silver King Well

The Silver King Well is a hand-dug well located within Lincoln County, Nevada, in southern Cave Valley as shown in [Figure 2-3](#). The dug well may have been a modification to a historic spring. Water is discharged from the Silver King Well by gravity drainage through approximately 600 ft of 2-in. pipe into a partially buried trough. Photos of the Silver King Well and discharge area are presented in SNWA (2009b). Photos taken May and October 2014 are presented in [Figures E-11](#) and [E-12](#), respectively.

Water-level data collected at the Silver King Well is limited prior to implementation of the SNWA monitoring program with only two records available. A depth-to-water level on March 21, 1990, was reported as 8.90 ft bgs. The second depth-to-water measurement was made on August 25, 2003, and was reported as 7.95 ft bgs. Two depth-to-water measurements were taken in 2014. The first, on May 5, 2014 was 11.32 ft bgs and the second, on October 13, 2014 was 11.11 ft bgs.

2.3.2.5 Coyote Spring

Coyote Spring is located in Dry Lake Valley on SNWA property approximately 8 mi west-southwest of Bristol Wells, Nevada ([Figure 2-3](#)), and lies at the center of an abandoned homestead compound now used for livestock management. Two spring orifices exist at the site. Photos of Coyote Spring and the discharge area in 2009 are presented in SNWA (2009b). Photos taken in May and October 2014 are presented in [Figures E-13](#) and [E-14](#), respectively.

Coyote Spring discharges from the base of an escarpment approximately 15 ft high in volcanic rocks. The spring discharge is collected and piped to a large concrete tank. Discharge from Coyote Spring was measured at 5 gpm in 1912 and at 0.9 gpm in August 1979. On June 3, 2004, discharge was measured at 0.11 gpm. On June 21, 2004, the discharge was 0.02 gpm. Discharges during the field visits on May 5 and October 13, 2014 were 0.09 gpm and 0.83 gpm, respectively.

2.3.2.6 Big Mud Springs

Big Mud Springs are located in northern Dry Lake Valley as shown in [Figure 2-3](#). The springs are located in the Schell Creek Range along Big Mud Pass approximately 7 mi north of Silver King Mountain. A wood fence is present at the springs. The area is surrounded by dense vegetation, such as junipers, willows, and wild roses. A collection basin is in place to divert the spring discharge for stock watering.

Photos of Big Mud Springs and water storage tanks in 2009 are presented in SNWA (2009b). Photos of the springhead taken in May and October 2014 are presented in [Figures E-15](#) and [E-16](#), respectively.

2.3.2.7 Littlefield Spring

Littlefield Spring is located approximately 3 mi south of Meloy Spring on the east side of Dry Lake Valley ([Figure 2-3](#)). Littlefield Spring discharges from the alluvium near an outcrop of volcanic rock.

This spring had a reported discharge of 0.02 cfs in May 1980 (Bunch and Harrill, 1984). No diversions exist near the spring. The spring head for Littlefield Spring was restored in 2004. A photo of the spring discharge area taken in May 2014 is presented in [Figure E-17](#). The photo taken in October 2014 of the spring area and discharge measuring point is presented in [Figure E-18](#). Discharge measurements on May 5 and October 13, 2014 were 0.02 and 0.03 cfs, respectively.

2.3.2.8 Grassy Spring

Grassy Spring is located in Delamar Valley approximately 40 mi south of Bristol Wells, Nevada, along the western flank of the Delamar Mountains ([Figure 2-3](#)). Photos of Grassy Spring taken in May and October 2014 are presented in [Figures E-19](#) and [E-20](#). Grassy Spring is currently used for stock watering. The discharge is captured at the source and is transferred to livestock-watering tanks through black polyvinyl tubing.

The spring discharges from alluvial sediments in close contact with volcanic rocks. The discharge was measured volumetrically at the livestock tank, approximately 300 ft west of the spring. The site was dry during the field visit on May 5, 2014. On October 13, 2014, the discharge was measured at 8.50 gpm at the cattle trough. This is an unusually high measurement for this site. A large precipitation event occurred in the vicinity of Grassy Spring several weeks prior to the October discharge measurement.

2.4 Precipitation-Station Network

Precipitation-station data from selected network sites which are currently operating and have an established historical record in the vicinity of the study area were compiled and are presented in [Appendix F](#). Data collected from the precipitation network will assist in assessing climate variability in the vicinity of the project basins and discerning pumping effects from natural variability. The precipitation network stations are listed in [Table 2-5](#) and are presented on [Figure 2-4](#).

The precipitation-station network includes the following:

- One high-altitude precipitation station operated by NDWR located in the Wilson Creek Range. This data is cited from Nevada Division of Water Resources (NDWR, 2015).
- Eight high-altitude precipitation stations maintained and operated by USGS through the CFA with SNWA and NDWR. This data is cited from USGS National Water Information System (USGS, 2015).
- Ten National Oceanic and Atmospheric Administration, National Weather Service (NOAA/NWS) Stations. Data were obtained through the Western Regional Climate Center (WRCC). This data is cited from Western Regional Climate Center (WRCC, 2015).
- One U.S. Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS) SNOwpack TELemetry (SNOTEL) site located in the Egan Range. This site provides

- precipitation and snow-accumulation data. This data is cited from USDA Natural Resources Conservation Service (USDA, 2015).

Provisional CY 2014 precipitation data for the stations, along with historical data and statistics, are presented in [Appendix F](#). USGS data from seven of the eight high-altitude precipitation stations were unavailable as of time of report publication. SNWA will continue to compile and report precipitation data from these sites as long as the data are made available and the stations are in operation.

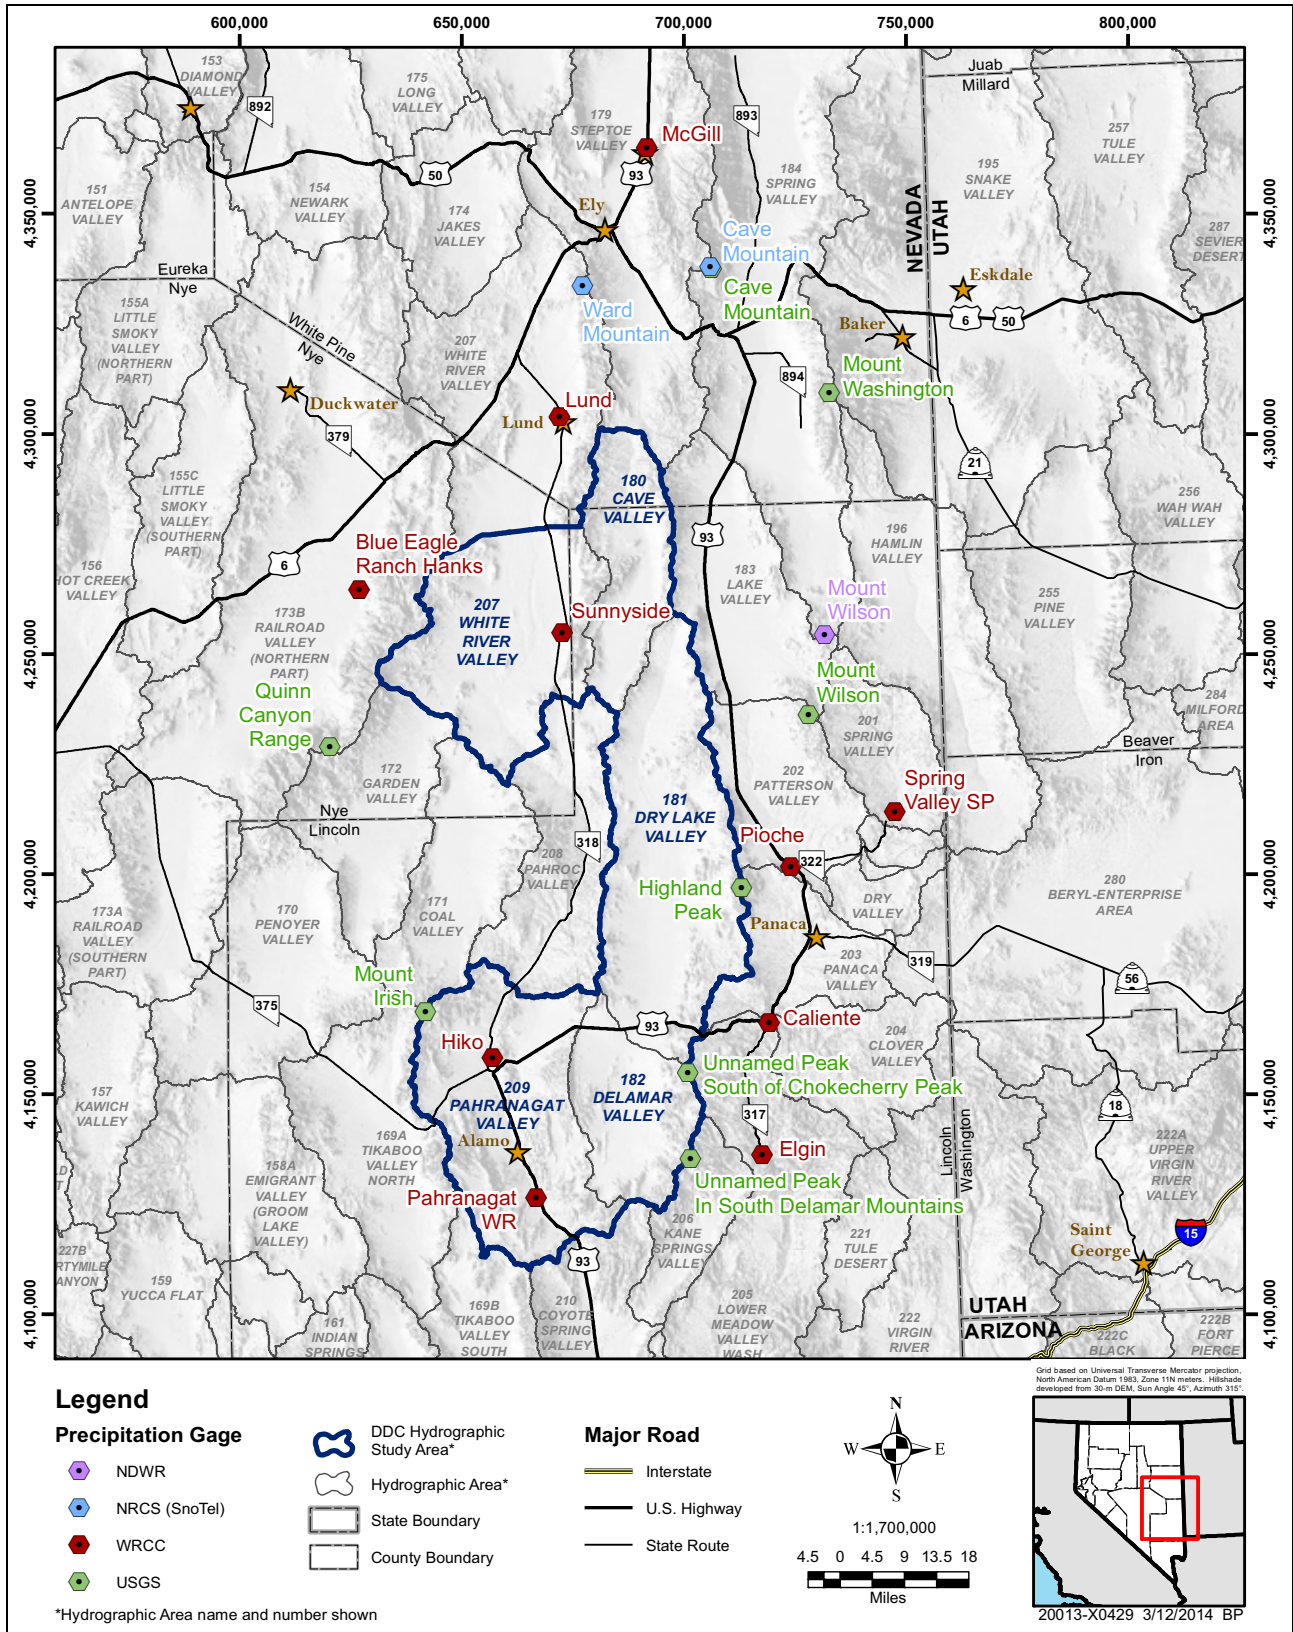

Figure 2-4
DDC Precipitation-Station Locations

2.5 Water Chemistry

A summary of water-chemistry data for samples collected from program wells and springs were presented in SNWA (2009b). The samples were collected by SNWA, USGS, and Desert Research Institute. Additionally, data reported in published reports dating as far back as 1912 (Carpenter, 1915) are included. On July 2, 2009, water samples were collected from Hiko and Hardy springs and analyzed for a suite of chemical constituents. The results for these samples were presented in SNWA (2010).

Spring field measurements of the water-quality parameters were performed in accordance with SNWA and the National Field Manual for the Collection of Water-Quality Data (USGS, 2008) procedures. All measurement equipment was calibrated according to the manufacturer calibration procedures.

On March 31, 2010 the TRP held a conference call to discuss the water-chemistry sampling programs required by the DDC3M Plan. The TRP recommended to the EC that the water-chemistry sampling program be postponed and implemented after the three future monitor wells specified in the DDC3M Plan have been installed. The EC approved the TRP recommendation. Implementation of the program will include collection of two rounds of water-chemistry samples six months apart at 10 locations selected by the TRP. SNWA will collect and submit samples for chemical analysis for the water-chemistry parameters listed in [Table 2-6](#). Subsequent sampling will be performed once every 5 years following the start of SNWA groundwater production.

Table 2-6
Water-Chemistry Parameters

Field Parameters	Major Ions	Isotopes	Minor and Trace Elements
Water temperature	TDS	Oxygen-18	Arsenic
Air temperature	Calcium	Deuterium	Barium
pH	Sodium	Tritium	Cadmium
Electrical conductivity	Potassium	Chlorine-36 ^a	Chromium
Dissolved oxygen	Chloride	Carbon-14 ^a	Lead
	Bromide	Carbon-13 ^a	Mercury
	Fluoride	Strontium-87 ^a	Selenium
	Nitrate	Uranium-238 ^a	Silver
	Phosphate		Manganese
	Sulfate		Aluminum
	Alkalinity		Iron
	Silica		Bromide
	Magnesium		Fluoride

^aThese parameters shall be included only in the first sampling event and shall not be included in any further water-chemistry sampling performed pursuant to this plan.

2.6 Data Reporting

A data-exchange web site accessible by the NSE, EC, TRP, and BRT members was created in April 2008. The data-exchange web site is used to distribute DDC3M Plan monitoring data to the TRP

within 90 days of collection. Data is also submitted directly to the NSE on a quarterly basis in electronic format.

A data and status report is submitted annually to the TRP and NSE.

2.7 Proposed Schedule of Groundwater Withdrawals

No groundwater production is scheduled for the next two years.

3.0 ANTICIPATED 2015 SNWA DDC3M PLAN ACTIVITIES

Anticipated DDC3M Plan activities in CY 2015 are summarized below.

- Continue to collect required quarterly and continuous water-level and spring discharge measurements at program sites throughout 2015.
- Report data quarterly to TRP members through the SNWA data-exchange web site. Data will also be submitted to NSE in an approved electronic format and be included in the annual data report to be submitted in March 2016.

SNWA will continue to work with the NSE and the other members of the TRP participants to implement the DDC3M Plan and identify and address technical issues related to the program.

Appendix B

DDC3M Plan
Continuous Water-Level Data

B.1.0 MONITORING PROGRAM WELLS WITH CONTINUOUS TRANSDUCER DATA

Continuous data collection was performed in CY 2014 for the following monitor wells:

- Cave Valley Well 180W902M
- Cave Valley Well 180W501M
- Delamar Valley Well 182M-1
- Dry Lake Valley Well 181M-1
- Dry Lake Valley Well 380531114534201
- Pahranaagat Valley Well 209M-1

For these sites, two hydrographs are presented that include data collected in CY 2014 and during the historical period of record. Continuous data have been corrected for temperature and transducer cable stretch.

Appendix E

DDC3M Plan
2014 Springs Site Photos

E.1.0 INTRODUCTION

This appendix presents photos taken in CY 2014 during the biannual field visits to document DDC spring conditions. Many of the DDC springs are controlled by collector systems and have been modified from their natural condition. Others, such as Littlefield and Cave Springs, remain in their natural condition.

Jason King, P.E., State Engineer
Nevada Division of Water Resources
901 S. Stewart Street, Suite 2002
Carson City, Nevada 89701

Dear Mr. King:

SUBJECT: SUBMITTAL OF ANNUAL MONITORING REPORTS FOR SELECTED SNWA PERMITS IN SOUTHERN AND EASTERN NEVADA

Please find enclosed the subject reports which are submitted in compliance with hydrologic monitoring and reporting requirements associated with water-right permits owned by the Southern Nevada Water Authority (SNWA) in eastern and southern Nevada. The reports and associated permits included in this submittal are described below:

2014 Annual Monitoring Report for SNWA Groundwater Permits in Coyote Spring, Garnet, and Hidden Valleys, Clark and Lincoln Counties, Nevada submitted for Permit Numbers 54073, 54074, 68822, 77291-77306, 70429, 70430, 74094, 74095, 79001-79010, and 83490. The report also includes data collected at monitoring sites located in adjacent hydrographic areas comprising the remaining portions of the southern White River and Lower Meadow Valley Wash flow systems.

2014 Spring Valley Hydrologic Monitoring, Management, and Mitigation Plan Status and Data Report submitted in satisfaction of reporting requirements set forth in the hydrologic monitoring plan approved by the Nevada State Engineer (NSE) associated with Ruling 6164.

2014 Delamar, Dry Lake, and Cave Valleys Hydrologic Monitoring, Management, and Mitigation Plan Status and Data Report submitted in satisfaction of reporting requirements set forth in the hydrologic monitoring plan approved by the NSE associated with Rulings 6165 through 6167.

Electronic files containing the 2014 hydrologic and groundwater-production data collected under the various monitoring programs associated with these permits have previously been submitted to your office in the required format.

If you have any questions concerning these reports, please contact Andrew Burns at (702) 862-3772.

Sincerely,

Zane L. Marshall
Director, Resources & Facilities

Dear Stipulation Executive Committee Members:

SUBJECT: SUBMITTAL OF THE 2014 SPRING VALLEY AND DDC VALLEYS HYDROLOGIC MONITORING, MANAGEMENT AND MITIGATION PLAN STATUS AND DATA REPORTS

The Southern Nevada Water Authority (SNWA) hereby submits the subject reports to the Stipulation Executive Committee (EC). These reports are submitted in satisfaction of reporting requirements set forth in hydrologic monitoring plans associated with Exhibit A of the Stipulations for Withdrawal of Protests for Spring Valley and Delamar, Dry Lake, and Cave (DDC) valleys.

These reports provide the EC and Technical Review Panel with hydrologic data for calendar year 2014 and a status update of monitoring activities performed by SNWA. Copies of the reports and electronic data submittal have also been posted on the Spring Valley and DDC valleys data-exchange website.

If you have any questions regarding these reports, please contact Andrew Burns at (702) 862-3772.

Sincerely,

Zane L. Marshall
Director, Resources & Facilities
